What it is
Methotrexate is a well-established, effective treatment for several different types of rheumatic disease (rheumatoid arthritis and psoriatic arthritis) and severe psoriasis. It may also be used for other conditions, including inflammatory bowel disease.

What it can do
It can reduce inflammation (swelling) so that joints do not stiffen, skin thicken as much, or in the digestive tract. It is not a painkiller.

Seeing the benefits
It may be 3 to 12 weeks before you notice any benefits - but it is working during this period. Rheumatoid arthritis, psoriasis and inflammatory bowel disease are chronic conditions and methotrexate may need to be taken for several years.

Your dose
Once a week
Your tablets should be taken once a week on the same day each week.

How to take methotrexate
You should take the tablets by mouth, one hour after food in the evening. Take the tablets with a glass of water while you are sitting or standing. Swallow the tablets whole and do not crush or chew them.

Take care
Handle the tablets as little as possible. Store them at room temperature and out of children’s reach.

Depending upon how well the tablets work for you, the dose you need to take may change. If your dose changes, the number of tablets you should take may change. But you will still only need to take them once a week. Methotrexate is made in two different strengths, 2.5mg and 10mg. The two strengths are different shapes but are a very similar colour, so always check you have been given the right strength by your doctor or pharmacist.

Do not take the tablets if you think you have the wrong strength. Check with your doctor or pharmacist as soon as possible.

If you are sick
If you are sick within a few hours of taking methotrexate tell your GP. You may be told to take another dose or to wait until the next dose is due the following week. Patients who are regularly sick after every dose may be given methotrexate by injection instead.

Why you need regular blood tests
It is important that you do not miss your blood test. You must not take methotrexate unless you are having regular blood tests every 4 to 12 weeks. They tell your doctor how well methotrexate is working.

Methotrexate reduces the production of blood cells and this can make you more vulnerable to infections. Blood tests will show if you are developing any side effects. If your blood, liver, kidneys or lungs are being affected, your treatment will be changed or stopped immediately.

Avoid having blood tests done directly after taking your dose as this can mask any changes.

When you start taking methotrexate, your doctor will give you a booklet in which the results of your blood tests must be recorded. This will help you, your doctor and pharmacist know that the dose is right for you and not adversely affecting your body. Your doctor may increase or decrease the number of tablets you take at each dose depending upon the results of your tests.

Possible side effects
Most people do well on methotrexate but it can affect your immune system and make you more vulnerable to illness. Occasionally, it can also produce side effects, some immediately and some within a few weeks.

Immediate side effects (within 48 hours)
Tell your doctor if these symptoms persist or occur after every dose:
- sickness
- diarrhoea
- skin rashes

Delayed side effects (within 2 to 3 weeks)
- mouth ulcers
- hair loss

Long term side effects (these side effects are rare)
- inflammation of the lung - if you become breathless, tell your doctor immediately
- bone marrow damage - your regular blood count test will check how well your bone marrow is working. Possible indicators of bone marrow damage are anaemia, regularly catching infections, and bruising and bleeding easily

The patient information leaflet in your tablet packet has a more detailed list of possible side effects.

Some doctors also prescribe folic acid tablets as these can reduce the likelihood of side effects. Care needs to be taken as folic acid tablets may look like the methotrexate tablets.
Things to tell your doctor immediately

If you have any of the following, tell your doctor immediately:

- infections including fever, chills or sore throats
- unexplained skin rash, ulcerations or soreness of skin
- yellowing of the skin or generalised itching
- bleeding gums, black tarry stools or unexpected bleeding or bruising
- chest pain, difficulty breathing or a dry, persistent cough
- sore mouth or mouth ulcers
- severe and continuing diarrhoea, vomiting or stomach pains
- vaginal inflammation or ulcers

See your doctor if you develop any new symptoms after starting methotrexate.

Chicken pox and shingles

If you are taking methotrexate and you develop chicken pox or shingles and it seems to be severe, you should see your doctor as you may need special treatment.

Other advice

Taking other medicines

Always check with your doctor or pharmacist before taking any other medicine. This includes medicines you can buy at a garage, newsagent, supermarket or chemist such as aspirin, paracetamol, other painkillers and medicines for coughs, colds and flu. This equally applies to herbal and alternative remedies. These can react with methotrexate and affect your treatment.

Also, the symptoms you are trying to treat may be a sign of methotrexate not working safely for you. It is important for your doctor or pharmacist to know so they can help you. Keep a record of any symptoms and discuss them with your doctor.

Drinking alcohol

Alcohol can react with methotrexate so it is advisable not to drink. However, an occasional drink may not be expected to cause significant side effects. Your doctor can give you more information and advice about this.

Food

Food made from unpasteurised milk, such as soft cheese and uncooked meats such as pate, may be a source of bacteria which could increase your risk of infection. Read food labels carefully, and avoid eating these types of food.

Vaccinations

Your doctor or nurse should not offer you any immunisation injections that have any of the live vaccines such as polio and rubella (German measles). However, flu vaccines are safe.

Having a baby

Methotrexate can reduce fertility in men and women. It can also damage an unborn child.

Women: Do not take methotrexate if you are pregnant or breastfeeding. It is recommended that you wait six months after finishing your treatment, before trying to become pregnant. You should talk to your doctor or nurse about effective contraception.

Men: It is recommended that you wait six months after finishing your treatment, before trying to father a child as your sperm can be affected. You should use effective contraception; talk to your doctor or nurse if you need advice.

Other information

If your treatment ends and you have some tablets left over, return them to your pharmacist. Do not flush them down the toilet or throw them away.

Currently, methotrexate is not licensed for use in inflammatory bowel disease. Medicines are often used outside the product license. The usage of methotrexate in this condition is low and therefore it is not economic for the makers to send the product for approval. However, please be reassured that your healthcare team have thought very carefully about selecting the best medicine for you. If you have any concerns regarding this medicine please contact your healthcare team.

When you were given this leaflet, you should also have received a booklet for recording your blood test results. If you did not receive one, ask your hospital clinic for a copy.
